WPQM MANUFACTURING

Warehouse Management

Warehousing and logistics

Digitalise, Integrate and Optimise industrial operations

Shop floor performance starts with reliable stock. We work on location management, internal flows and container traceability, tied directly to production.

HOW WE WORK

We start from a map of actual movements, then size identification to the real need: a well-placed barcode often beats a full RFID roll-out.

WAREHOUSE MANAGEMENT

— Stock management
Reliable quantities, cycle counting, multi-location and multi-unit handling.

— WMS
Selection, configuration or development of the warehouse management system, tied to the ERP.

— Traceability
Unique container identification, upstream and downstream genealogy, targeted recall when an incident occurs.

— Logistics flows
Goods-in, put-away, picking, line-side replenishment and dispatch.

— RFID, barcodes and IoT
Choice of identification technology, labelling plan and integration of fixed and handheld readers.

TYPICAL DELIVERABLES

- Flow map and data capture points
- Identification and labelling plan
- WMS/ERP interface specification
- Stock count and adjustment procedures
